TRIANGULAR SPACES

Triangular spaces in urban environments are highly prized. They represent a junction of more than two streets, offering wider, more interesting views and a vantage point from which to understand where you are in the city. These spaces make cities easier to navigate and therefore more walkable.

Wellington's central city has an abundance of triangular spaces which were created where the original city street grid met the old shoreline. They make a significant contribution to the central city's compact, distinctive, pedestrian-friendly form and tell an important story about the way Wellington has changed over time.

This project involves redesigning the following key triangular spaces to make the most of their special features and strategic locations. These redevelopments will improve connections to the waterfront and other civic spaces, create higher quality open, cultural and performance spaces, and revitalise parts of the city.

- 1. Te Aro Park** – could be better integrated into Cuba Mall and offer a performance space.
- 2. Michael Fowler Centre car park** – could be a new civic space that revitalises the entry to the Michael Fowler Centre and better connects the city to the waterfront.
- 3. The intersection of Victoria and Wakefield streets** – could better connect two significant streets to Civic Square, the Central Library and through to the waterfront.
- 4. The intersection of Lambton Quay and Hunter Street** – could better emphasise the important heritage buildings and improve the intersection of these important streets.
- 5. Post Office Square** – could offer a more attractive open space with better links to the waterfront.
